DETAILED ACTION

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that

form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 26 and 27 are rejected under 35 U.S.C. 102(b) as being anticipated by

Olez et al. (4,863,330). Olez discloses a fiber reinforced core (22) in column 4, lines 36-

38) having a fixating element (24) at a head end (34) thereof.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all

obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 12-25 are rejected under 35 U.S.C. 103(a) as being unpatentable over

Olez et al. (4,863,330) in view of Carmien (5,421,931). Olez discloses a pultruded fiber

reinforced core (22) that is cut from a body (column 5, lines 8-11) and has an end part

(34) formed into a specific configuration (32) to receive a fixating element (24). An

overwrap material (16) is a resinous material (column 5, lines 39-42) and is formed into

a casing (62) to fixate the fixating element (24) to the core (22) to form a subassembly.

The subassembly is encased in the casing (62) by adhesion during a heat and pressure

forming step (column 6, lines 58-67). The casing (62) is circular or cylindrical (figure

Application/Control Number: 10/501,285 Art Unit: 3725

4b). The fixating element has an end surface defining an angle relative to an axis of the core. Olez does not disclose that the casing is applied by pultrusion. Carmien teaches cores (26,28) that are encased by resin coated fibers (32) in a pultrusion process. The finished encased (30) rod sections (18) are cut to length by a cutting means (46). It would have been obvious to one skilled in the art at the time of invention to apply the casing of Olez to the core by a pultrusion process as taught by Carmien in order to continuously produce multiple elements in an in-line process.

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
